DRUG SALES REPORT

The primary business problem for the drug sales report is the lack of comprehensive and accurate data integration from multiple sources, leading to inefficiencies in tracking sales performance, market trends, and inventory levels. This fragmentation hinders the ability to make informed decisions on marketing strategies, supply chain management, and resource allocation. Additionally, inconsistent reporting formats and delayed data updates further complicate the analysis, resulting in missed opportunities for optimizing sales processes and responding to competitive pressures effectively. Streamlining data collection and implementing real-time, standardized reporting mechanisms are crucial for addressing these challenges and enhancing overall sales performance.

Data Set : To conduct this analysis, a comprehensive dataset comprising daily, quarterly, and yearly sales data was collected from Kaggle and imported into Power BI. Power Query was employed to clean and transform the data, ensuring its accuracy and consistency. and enhanced it by adding additional columns and merging it to optimize its quality.

Based on these insights, I recommend the following actions for pharmaceutical companies:

- **Focus on leveraging the popularity by investing in its promotion and further enhancing its market presence.**
- **Explore opportunities to improve the sales performance by conducting market research, identifying customer needs, and tailoring marketing strategies accordingly.**
- **Continuously monitor and analyze sales trends on a daily, quarterly, and yearly basis to stay informed and adapt strategies accordingly.**

WHAT WENT WELL

- THE DATA VISUALIZATION IN POWER BI CLEARLY HIGHLIGHTED THE TRENDS AND PATTERNS IN DRUG SALES.
- THE INTERACTIVE DASHBOARDS ALLOWED FOR EASY FILTERING AND DEEP DIVES INTO SPECIFIC AREAS OF INTEREST.
- THE INTEGRATION OF VARIOUS DATA SOURCES WAS SEAMLESS, PROVIDING A COMPREHENSIVE OVERVIEW.

WHAT DID NOT GO WELL

- SOME DATA INCONSISTENCIES WERE FOUND, AFFECTING THE ACCURACY OF CERTAIN REPORTS.
- PERFORMANCE ISSUES WERE ENCOUNTERED WITH LARGER DATASETS, SLOWING DOWN THE RESPONSIVENESS OF THE DASHBOARDS.
- SOME DAX FORMULAS WERE MORE COMPLEX THAN ANTICIPATED, LEADING TO ERRORS AND LONGER DEVELOPMENT TIME.

WHAT WOULD YOU DO DIFFERENTLY NEXT TIME

- IMPLEMENT A MORE RIGOROUS DATA VALIDATION PROCESS TO ENSURE DATA ACCURACY.
- OPTIMIZE THE DATA MODEL TO IMPROVE PERFORMANCE WITH LARGE DATASETS.
- SIMPLIFY DAX CALCULATIONS WHERE POSSIBLE AND VALIDATE THEM THOROUGHLY DURING DEVELOPMENT.

Comparisons between Tableau and PowerBI
